1
Log z_t.
Re-record the 12 routes with traffic light, goal distance, junction, road option and actor state at every step.
2
Label onsets.
For each of the 40 onsets, name the privileged variable that changed first.
3
Hypotheses.
H1 route end, H2 light range, H3 junction or road option, H4 other or mixed.
4
Repair and controls.
Add the matching feature; also add a random input and a correlated non-cause.
5
Retrain, compare.
Same seed and splits: UER, lead time, braking delay, HDI.
UER does not fall: revise the hypotheses
